How to read the topdump traffic log

This reading explains how to identify the brute force attack using topdump.

```
14:18:32.192571 IP your.machine.52444 > dns.google.domain: 35084+ A? yummyrecipesforme.com. (24)

14:18:32.204388 IP dns.google.domain > your.machine.52444: 35084
1/0/0 A 203.0.113.22 (40)
```

The first section of the DNS & HTTP traffic log file shows the source computer (your.machine.52444) using port 52444 to send a DNS resolution request to the DNS server (dns.google.domain) for the destination URL (yummyrecipesforme.com). Then the reply comes back from the DNS server to the source computer with the IP address of the destination URL (203.0.113.22).

```
14:18:36.786501 IP your.machine.36086 > yummyrecipesforme.com.http:
Flags [S], seq 2873951608, win 65495, options [mss 65495,sackOK,TS val 3302576859 ecr 0,nop,wscale 7], length 0
14:18:36.786517 IP yummyrecipesforme.com.http > your.machine.36086:
Flags [S.], seq 3984334959, ack 2873951609, win 65483, options [mss 65495,sackOK,TS val 3302576859 ecr 3302576859,nop,wscale 7], length 0
```

The next section shows the source computer sending a connection request (Flags [S]) from the source computer (your.machine.36086) using port 36086 directly to the destination (yummyrecipesforme.com.http). The .http suffix is the port number; http is commonly associated with port 80. The reply shows the destination acknowledging it received the connection request (Flags [S.]). The communication between the source and the intended destination continues for about 2 minutes, according to the timestamps between this block (14:18) and the next DNS resolution request (see below for the 14:20 timestamp).

TCP Flag codes include:

Flags [S] - Connection Start Flags [F] - Connection Finish Flags [P] - Data Push Flags [R] - Connection Reset Flags [.] - Acknowledgment

```
14:18:36.786589 IP your.machine.36086 > yummyrecipesforme.com.http:
Flags [P.], seq 1:74, ack 1, win 512, options [nop,nop,TS val
3302576859 ecr 3302576859], length 73: HTTP: GET / HTTP/1.1
```

The log entry with the code **HTTP: GET / HTTP/1.1** shows the browser is requesting data from **yummyrecipesforme.com** with the **HTTP: GET** method using **HTTP** protocol version **1.1**. This could be the download request for the malicious file.

```
14:20:32.192571 IP your.machine.52444 > dns.google.domain: 21899+ A? greatrecipesforme.com. (24)

14:20:32.204388 IP dns.google.domain > your.machine.52444: 21899 1/0/0 A 192.0.2.172 (40)

14:25:29.576493 IP your.machine.56378 > greatrecipesforme.com.http: Flags [S], seq 1020702883, win 65495, options [mss 65495,sackOK,TS val 3302989649 ecr 0,nop,wscale 7], length 0

14:25:29.576510 IP greatrecipesforme.com.http > your.machine.56378: Flags [S.], seq 1993648018, ack 1020702884, win 65483, options [mss 65495,sackOK,TS val 3302989649 ecr 3302989649,nop,wscale 7], length 0
```

Then, a sudden change happens in the logs. The traffic is routed from the source computer to the DNS server again using port .52444 (your.machine.52444 > dns.google.domain) to make another DNS resolution request. This time, the DNS server routes the traffic to a new IP address (192.0.2.172) and its associated URL (greatrecipesforme.com.http). The traffic changes to a route between the source computer and the spoofed website (outgoing traffic: IP your.machine.56378 > greatrecipesforme.com.http and incoming traffic: greatrecipesforme.com.http > IP your.machine.56378). Note that the port number (.56378) on the source computer has changed again when redirected to a new website.
